ACTION CHECKLIST

Your 4-Week Loyalty Personalization Roadmap

From zero personalization to measurable Assisted Orders in 28 days. One tactic per week, with setup steps you can follow today.

WHAT YOU'LL HAVE AFTER 28 DAYS

- ✓ 2-3 reward choices live, with redemption data showing which customers prefer what
- ✓ One automated win-back trigger firing on lapsed customers every day
- ✓ One zero-party data segment ready for targeted campaigns
- ✓ A baseline Assisted Orders number to measure every future optimization against
- ✓ More personalization running than 84% of Shopify stores after 6 months

Before You Start: Prerequisites

Joy Loyalty Installed

Free plan works for Week 1. Advanced plan needed for VIP tiers and custom rules.

apps.shopify.com/joy-loyalty

Email Tool Connected

Klaviyo, Omnisend, or Mailchimp. Required for Week 2 behavioral triggers.

Joy Settings → Integrations

Shopify Flow Enabled

Free on all Shopify plans. Powers the automation between Joy and your email tool.

Shopify Admin → Apps → Flow

30+ Days of Orders

Need at least one month of purchase history to set meaningful win-back timing.

Check: Analytics → Orders

Weeks 1-2: Build the Foundation

Start with what requires zero customer data, then add your first automated trigger.

1 Add Reward Choices

The Songmont play. If you only offer a flat discount (e.g., "$5 off"), most customers ignore it. Adding 2-3 options at the same point level lets customers self-select, which increases redemption and reveals preferences with zero prior data.

SETUP STEPS

- [ ] **Go to Joy → Rewards → Create New Reward.** Select "Product Reward" as the type.
- [ ] **Pick a product from your Shopify catalog** (branded item, sample, or accessory) and set the point threshold (e.g., 400 points).
- [ ] **Create a second reward** at the same point level: "Free Shipping" or a different product option.
- [ ] **Create a third reward** (optional): a higher-value item at a higher point level to extend engagement over weeks.
- [ ] **Set a minimum purchase requirement** under Redemption Rules (e.g., $25 minimum) to protect margins.
- [ ] **Preview the loyalty widget** on your storefront. Confirm all options are visible and redeemable at checkout.

EXPECTED OUTCOME
Redemption rate increases within the first week. Songmont saw 5x lift on Black Friday.

COMMON MISTAKE
Offering 10+ options. Choice overload kills conversion. Stick to 2-3 per point level.

IT'S WORKING WHEN
Customers choose different rewards (not all picking the same one). That means the options are relevant.

2 Set Up One Behavioral Trigger

Connect Joy to your email tool via Shopify Flow and build a single win-back email. One trigger. One email. AI-driven campaigns deliver 21-22% hit rates vs. 7-10% for traditional segmentation (BCG).

SETUP STEPS

- [ ] **Open Shopify Flow → Create Workflow.** Set trigger: "Customer hasn't purchased in X days." Set X based on your repurchase cycle (coffee: 14 days, skincare: 45 days, apparel: 60 days).
- [ ] **Add condition:** Customer is a Joy loyalty member (has points balance > 0).
- [ ] **Add action:** Send email via Klaviyo/Omnisend. Use the customer's first name, current points balance, and a specific reward they can claim.
- [ ] **Write the email.** Subject: "You have [X] points waiting — here's what you can get." Body: show their balance, one reward image, one-click redemption link.
- [ ] **Set the workflow live.** It fires automatically for every qualifying customer, every day.

EXPECTED OUTCOME
2-5% of lapsed customers return within the first 2 weeks. Each return is tracked as an Assisted Order.

COMMON MISTAKE
Sending generic "We miss you" without the points balance. The number is what creates urgency.

IT'S WORKING WHEN
You see Assisted Orders appearing in Joy analytics from customers who received the win-back email.

Weeks 3-4: Layer Data, Then Measure

Add a zero-party data point, then read the results before adding complexity.

3 Collect One Zero-Party Data Point

Zero-party data is information customers give you voluntarily. Unlike behavioral data (months of history needed), it's available on day one. Only 16% of companies have achieved hyper-personalization (Capillary Tech) — this step puts you ahead of most.

SETUP STEPS

- [ ] **Choose one segmentation question** for your product. Coffee: "light, medium, or dark roast?" Skincare: "oily, dry, or combination?" Pet food: "dog or cat?"
- [ ] **Add it to your post-purchase thank-you page** or signup form using Octane AI, Typeform, or a native Shopify form.
- [ ] **Push each answer as a Shopify customer tag** (e.g., "roast:dark" or "skin:oily"). This is your segment identifier.
- [ ] **Create a Klaviyo segment** using the tag. Build one targeted email for that segment with a relevant product recommendation.
- [ ] **Connect to Joy:** use Shopify Flow to award 25 bonus points for completing the quiz. This incentivizes data collection.

EXPECTED OUTCOME
15-30% of customers complete the question. Each response is a targetable segment from day one.

COMMON MISTAKE
Asking 5+ questions. One question gets 3x more completions than a full survey. Keep it to one.

IT'S WORKING WHEN
Your first segment-targeted email outperforms your generic blast on open rate and clicks.

4 Read the Data and Adjust

Don't add a second trigger until you've read what the first three weeks produced. Open Joy analytics and check these specific numbers.

WHAT TO CHECK

- [ ] **Assisted Orders:** Go to Joy → Analytics → Assisted Orders. How many orders came from loyalty-driven touchpoints this month?
- [ ] **Reward preference:** Which of your 2-3 reward options did customers choose most? If one option has 70%+ selection, your other options need work.
- [ ] **Win-back performance:** In Klaviyo, check the win-back email's click rate and conversion. Did any lapsed customers actually return?
- [ ] **Zero-party data uptake:** What % of customers completed your preference question? If under 10%, add a points incentive or simplify the question.
- [ ] **Decision: If numbers are moving,** add a second trigger (milestone notification or points expiry reminder). **If flat,** adjust your reward options before adding complexity.

TARGET METRIC
Your baseline Assisted Orders number. Every future optimization gets measured against this.

COMMON MISTAKE
Tracking enrollment instead of redemption. Enrollment means people signed up. Redemption means they care.

Quick-Reference: What to Track and When

When	Metric	Where to Find It	"Good" Looks Like
Day 1	**Redemption rate by reward**	Joy → Analytics → Rewards	Any redemption within 7 days
Week 2	**Win-back email conversions**	Klaviyo → Campaign Analytics	2-5% of recipients return
Month 1	**Assisted Orders**	Joy → Analytics → Assisted Orders	Any orders attributed to loyalty
Month 3	**Repeat purchase rate (members vs. non)**	Joy Analytics + Shopify Reports	10%+ gap between members and non-members
Month 6	**CLV lift from loyalty members**	Shopify → Customers → Segments	20%+ higher CLV for loyalty members

Month 2: What Comes Next

After 4 weeks, you have the foundation. Here's how to build on it without overcomplicating.

Week 5-6: Add a Second Trigger

If your win-back email worked, add a milestone trigger: "You're 100 points from your next reward." This drives incremental purchases from already-engaged members. Set up via Shopify Flow → Joy points threshold condition.

Week 7: Add a Tier

Create a two-tier VIP program (e.g., Member + VIP at $200 annual spend). Give VIP members one exclusive perk: early access, free shipping, or a bonus multiplier. One meaningful perk beats five generic ones.

Week 8: Review and Double Down

Compare Month 1 vs. Month 2 Assisted Orders. If the number grew, you've validated your approach. Double down on what drove the most orders. Cut what didn't move the needle.

5 Mistakes That Kill Personalization Programs

- **Offering too many reward options.** More than 3-4 options per point level creates decision paralysis. Redemption drops. Start with 2-3, expand based on data.
- **Sending behavioral triggers too early.** Wait until you have 2+ purchases from a customer before triggering personalized offers. One purchase isn't a pattern.
- **Personalizing everything at once.** Pick one tactic, measure it for 4 weeks, then add the next. Layering 5 tactics in week 1 means you can't tell what's working.
- **Tracking enrollment instead of redemption.** 10,000 members who never redeem is a vanity metric. 500 members who redeem monthly is a revenue engine.
- **Running the same offers for VIPs and first-timers.** Your top 10% of customers should never see the same generic blast as someone who bought once 6 months ago. Segment or lose them.

Ready to Start Your 4-Week Roadmap?

Joy gives Shopify merchants reward choices, 22+ Shopify Flow triggers, Klaviyo/Omnisend integration, and Assisted Orders tracking — everything in this checklist, out of the box.
